

Mass Flow Meter (MFM)

- Nominal flow ranges from 20 l/min up to 2500 l/min
- High accuracy
- Fast response time
- Protection class IP65
- Optional: Fieldbus interface

Product variants described in the data sheet may differ from the product presentation and description.

Can be combined with

| | | |
|---|---|---|
|  | Type 8611 eCONTROL - Universal controller | ▶ |
|  | Type 0330 Direct-acting 2/2 or 3/2-way pivoted armature valve | ▶ |

|  | Type 6027 Direct-acting 2/2 way plunger valve | ▶ |

Type description

The mass flow meter (MFM) type 8006 is suited for measuring the mass flow of high gas flows. The thermal inline sensor is located directly in the gas stream and therefore reaches very fast response times. Type 8006 can optionally be calibrated for two different gases; the user can switch between these two gases. As electrical interfaces both, analog standard signals and fieldbuses are available. The MFM type 8006 is especially designed for use in harsh environments due to a low sensitivity to contamination and the high protection class.

1.) The nominal flow rate is the largest calibrated and measurable flow rate value.

The nominal flow range indicates the range of possible nominal flow values.

2.) Index N: Flow values with respect to 1.013 bar and 0 °C, alternatively

Index S: flow values with respect to 1.013 bar and 20 °C

5. Performance specifications

5.1. Pressure loss diagram of MFM

The diagram shows exemplary the pressure loss characteristics when air flowing through. For determining the pressure loss with another gas it needs to calculate the air equivalent and respect the fluidics needed with the other gas.

5.2. Flow characteristic

Nominal flow range of typical gases

Note:

All values regarding 1.013 bar(a) and 0 °C (Index N)

| Gas | Min. Q_{Nom} [l/min] | Max. Q_{Nom} [l/min] |
|----------------|------------------------|------------------------|
| Acetylene | 20 | 975 |
| Ammonia | 20 | 1250 |
| Argon | 20 | 1500 |
| Carbon dioxide | 20 | 800 |
| Air | 20 | 2500 |
| Methane | 20 | 750 |
| Propane | 20 | 400 |
| Oxygen | 20 | 2500 |
| Nitrogen | 20 | 2500 |

6. Product operation

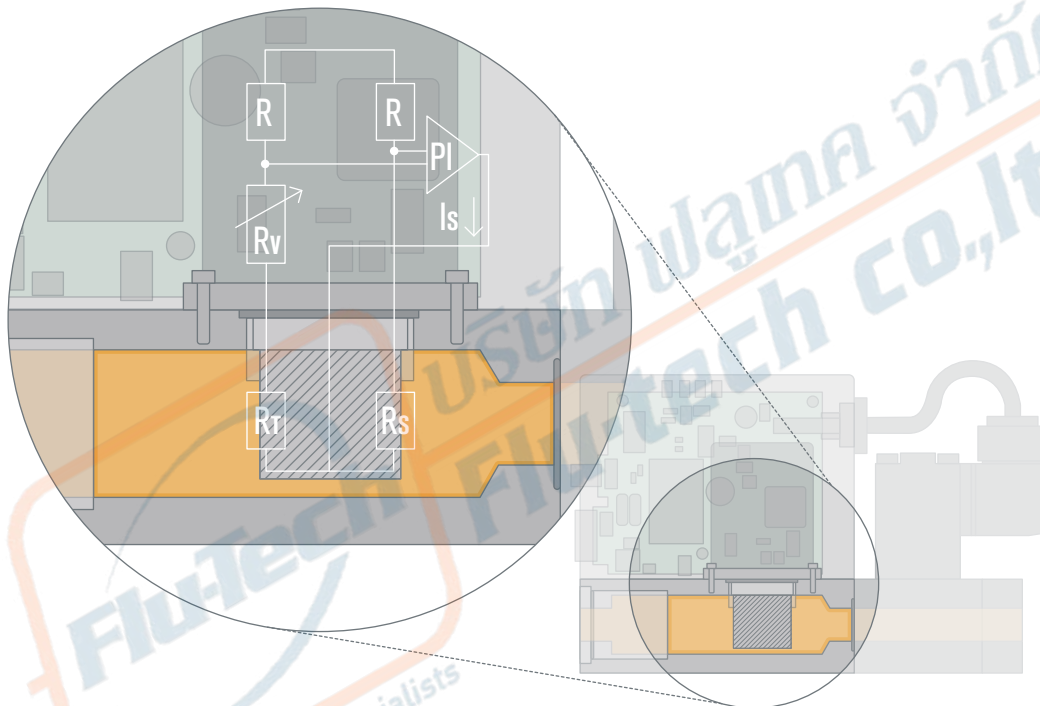

6.1. Measuring principle

This sensor works as a hot-film anemometer in the so-called CTA operational mode (Constant Temperature Anemometer). To do this, two resistors with precisely specified temperature coefficients located directly in the media flow and three resistors located outside the flow are connected together to form a bridge.

The first resistor in the gas flow (R_T) measures the fluid temperature, while the second, low-value resistor (R_S) is heated so that it is maintained at a fixed, predefined over-temperature with respect to the fluid temperature.

The heating current required to maintain this is a measure of the heat being removed by the flowing gas, and represents the primary measurement.

An adequate flow conditioning within the MFM and the calibration with high-quality flow standards ensure that the mass of gas flowing per time unit can be derived from the primary signal with high accuracy.

7.2. Recommendation regarding product selection

Note:

The **Product Enquiry Form** at the end of this document contains the relevant fluid specification. Using the experience of Bürkert engineers already in the design phase provide us with a copy of the request containing the necessary data together with your inquiry or order.

For the proper choice of the actuator orifice within the MFM, not only the required maximum flow rate Q_{Nom} , but also the pressure values directly before and after the MFM (p_1 , p_2) at this flow rate Q_{Nom} should be known. In general, these pressures are not the same as the overall inlet and outlet pressures of the whole plant, because usually there are additional flow resistors (tubing, additional shut-off valves, nozzles etc.) present both before and after the controller.

Please use the **Product Enquiry Form** at the end of this document to indicate the pressures directly before and after the MFM. If these are unknown or not accessible to a measurement, estimates are to be made by taking into account the approximate pressure drops over the flow resistors before and after the MFM, respectively, at a flow rate of Q_{Nom} . In addition, please quote the maximum inlet pressure $p_{1 max}$ to be encountered. This data is needed to make sure the actuator is able to provide a close-tight function within all the specified modes of operation.

1.) The adapters serve mainly for initial operation or diagnosis. Those are not obligatory for continuous operation.

2.) The M12 single connectors as listed here are not suitable for their simultaneous use with the Y-piece for reasons of space. Please always use at least one commercially available overmoulded cable whose connector is usually smaller.
