

# Flow injection analysis (FIA) sensor cube for iron content

- Fully automated water sampling with adjustable analysis interval
- · Miniaturised for a compact system design
- Economical consumption of reagents
- Fully compatible with büS systems and a wide range of further analysis sensor cubes

Product variants described in the data sheet may differ from the product presentation and description.

#### Can be combined with

#### **Type description**

Bürkert has developed an FIA (flow injection analysis ) module for the measure of dissolved iron ( $Fe^{2+}/Fe^{3+}$ ) for use in the online analysis system, which combines all necessary components including control in a minimum of space.

The special feature of Bürkert's FIA module is its consequent miniaturisation using microfluidic components. FIA has been used in laboratories for many years for quantitative analyses. With the FIA module, the method can now be used for the first time as a field device and continuously monitor the iron content of a measuring point.

In the flow injection analysis, the reagent is added to a water sample via a pump. The microfluidic mixing section after injection ensures uniform and complete mixing.

The measuring liquid then passes through a photometer, which measures the absorption over time. From the detected peak-shaped signal, the iron content can be determined photometrically and is then available for the control, monitoring and documentation of the water treatment.

Miniaturisation of the measuring unit and compatibility to all EDIP modules enable use in the Online Analysis System Type 8905. By plugging it into the fluidic backplane slot, the electrical and fluidic connections are made via the connection panel of the system. The measuring module communicates with the system via büS, allowing fully automatic login to the online analysis system. If the iron measuring module is plugged into the system, it is included in the list of büS members and further adaptations to customer requirements can be made.

See data sheet Type 8905 > for more information.

# 4. Product installation

#### 4.1. Installation notes

#### Note:

- The iron measurement with Type MS06 is designed for use with the online analysis system, Type 8905. The iron measuring module is simply plugged into the backplane of the Type 8905.
- If the product is supplied without housing, it can be mounted on a backplane combination and the backplanes are installed on a standard rail (TS35).
- In order to supply the device with the necessary reagents, an MZ30 module is used.

See data sheet Type 8905 > Online Analysis System, data sheet Type MZ30 > Reagent unit for more information.

#### 845/3-4 หมู่ 3 ถ.เทพารักษ์ ต.เทพารักษ์ อ.เมือง จ.สมุทรปราการ 102070

#### 4.2. Mounting options

The iron measuring module MS06 is installed onto a backplane of the Type 8905 (at least 4 places necessary or alternatively 3 places in series (one empty space)).

To do this, the lever is pushed to the right, the device is set up and then the lever is locked to the left. The electrical as well as the fluidic connection is thereby established and the sensor module iron measuring module is mechanically locked on the backplane. In order to supply the device with the necessary reagents, an MZ30 module is used. The connection between the reagent bottles and the iron measuring module is realized by connecting hoses with a preassembled connector. An appropriate connection is provided on the MS06 iron measuring module.

## 5. Product operation

#### 5.1. Measuring principle

Only for sampling, which is performed in user-defined time intervals, a partial stream is taken from the measuring water flow. The sample is processed separated from the main stream in the iron measuring module. A reagent is injected which, upon reaction with iron, forms a dye. For the determination of the iron content in the sample, the light absorption is used. After the analysis, the sample is discarded into the waste and the iron measuring module waits for the next measurement cycle, according to the user-defined time interval.

Operation is performed via the 7" display of the connected online analysis system, Type 8905 or if the product is delivered without display via ME21 or Bürkert Communicator.

The supplies of the operating agents (reagent, cleaning agent and calibration standard) are provided and monitored through the MZ30 module. The MZ30 module provides messages or warnings, e.g. when a reagent bottle needs to be replaced or will expire (the operating agents have a limited shelf life; the expiration date appears on the bottles).
