Type description

The device Type 8793 digital process controller is designed with standardisation according to IEC 60534 - 6 - 1 or VDI/VDE 3845 (IEC 60534 - 6 - 2) for assembly to linear and rotary actuators. The variant with remote position sensor can also be used to control Burkert process control valves. The process controller processes all standard current and voltage signals and can also be equipped with the fieldbus interface. The actual process value is supplied directly to the device as 4 - 20 mA, PT100 or as a frequency signal. The process controller calculates the position setpoint for the subordinated positioner via variance comparison. The parameterisation of process and position controllers can be carried out automatically via the P.TUNE and X.TUNE function. Operation is simple via the graphical display with keypad or via Burkert Communicator. The process controller is equipped with diagnostic functions to monitor the valve. The diagnostics can be used to monitor the operating conditions of the control valve which makes maintenance decisions predictable and optimises the availability of the plants as required. The pneumatic actuating system can be used equally for single-acting and double-acting actuators. It is characterised by a defined safety response in the event of the failure of the electrical or pneumatic auxiliary power and possesses an enormous air capacity range with pressure supply up to 7 bar.

Product choice

Note:

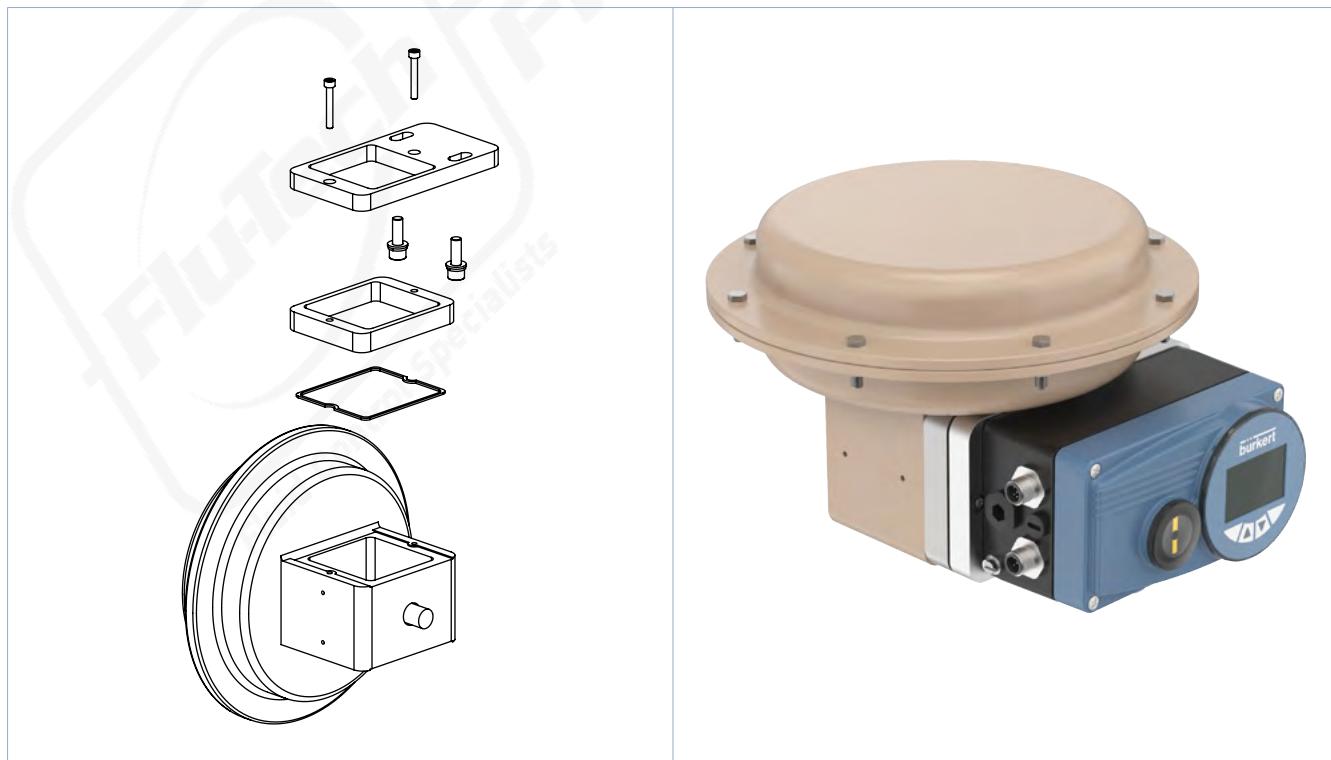

- The technical data of the listed actuators and valves from third-party manufacturers are subject to change. Sampling of the relevant adapter set is therefore required in all cases. The information on the combinability of the adapter sets is therefore subject to change.
- The ordering tables for adapter sets in chapter “[7.4. Ordering chart accessories](#)” on page 36 refer to the valve actuators from third-party manufacturers and not to the valves themselves.
- The actuator is therefore the decisive factor when selecting a suitable adaptation.
